The best thing you can do to deter cybercriminals in Outlook is to utilize the Spam filter. This moves messages you deem as "unwanted" into the Spam/Junk folder, and it also reports the sender to Microsoft as a questionable sender. Future messages from the sender address will be moved in the Spam/Junk folder. With the message open, in Outlook click on the "Home" Tab, click on the Junk/Spam icon for the drop down menu, and click Block Sender. You will also see there is a choice for adjusting "Junk E-mail Options", these are additional settings that let you tweak your Junk mail preferences.

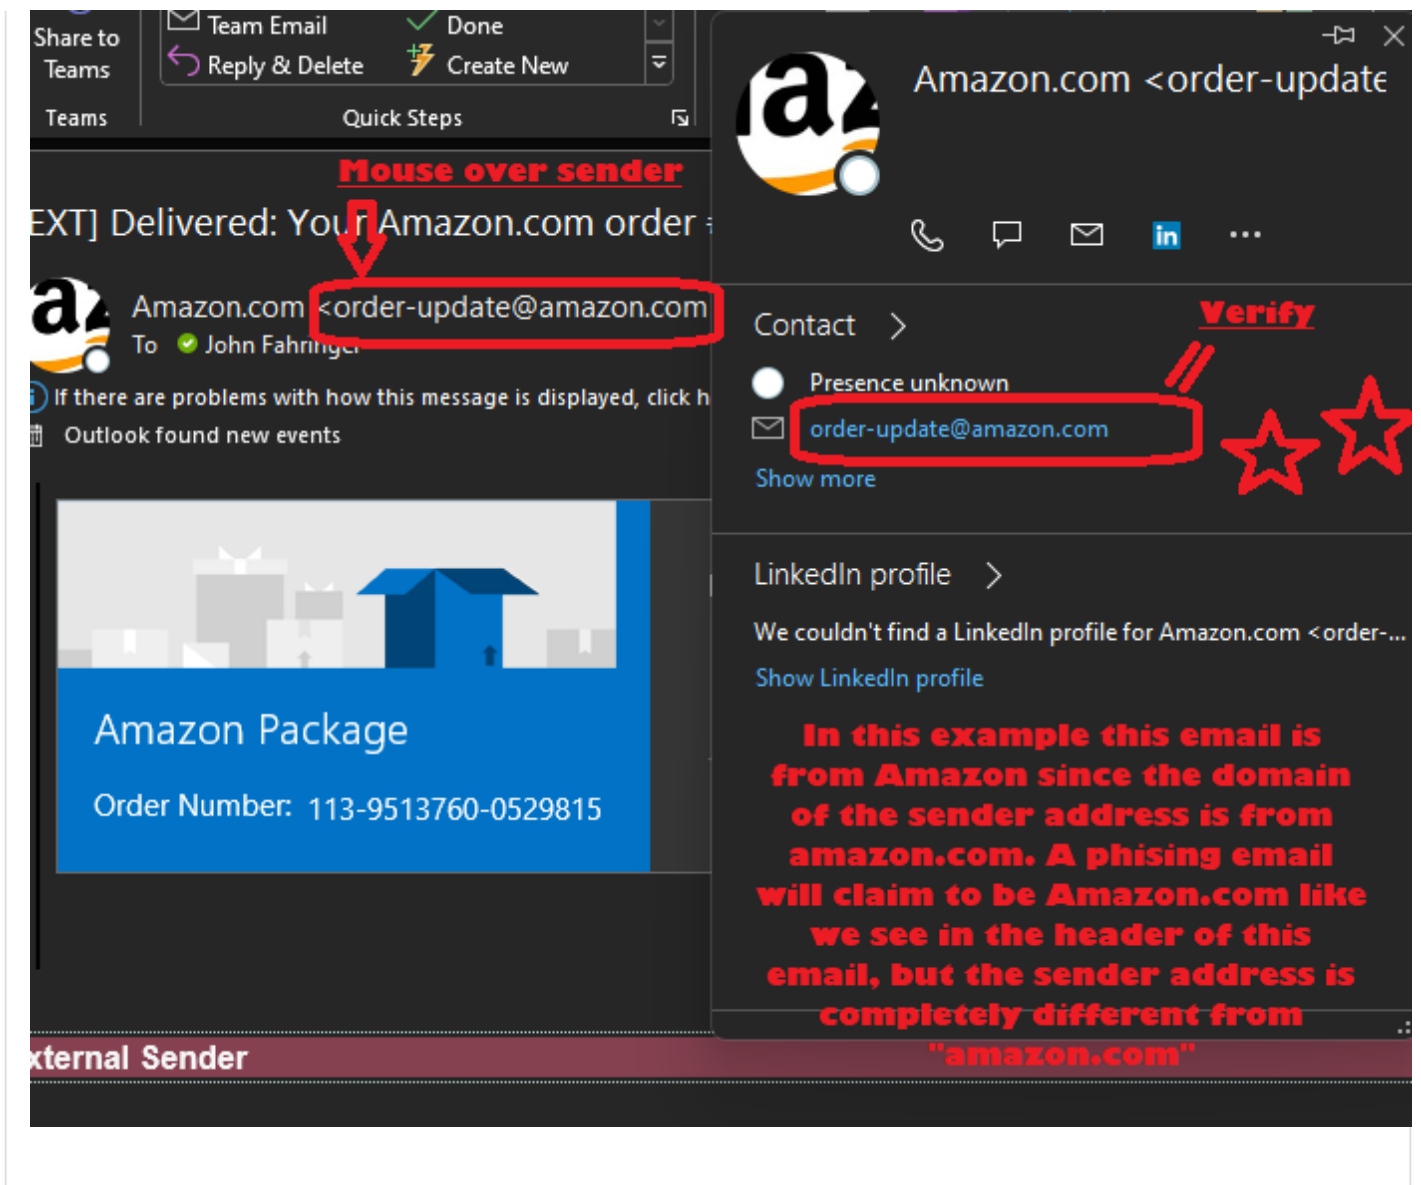

Optional Settings:
Feel free to try them if you are receiving a lot of unwanted outside email. If you choose a High level of protection or something similar, you may need to keep an eye on your Spam folder for false spam detection (i.e. an important email being sent to junk)?

If you accidentally mark something as spam that you didn't mean to, you can navigate to your Junk Email folder and find the email you accidentally moved. Right click it, mouse to Junk, and then choose an appropriate action. For example you can unblock the sender if you blocked them by accident. Once you are satisfied with the options, you can click Not Junk to move the email out of

The screenshot displays the Outlook application window. On the left, the navigation pane shows folders like Favorites, Deleted Items, Drafts, and Junk Email. The main pane shows a list of emails, with one selected from 'Microsoft Feedback'. A right-click context menu is open over the selected email, listing actions such as Copy, Quick Print, Reply, Forward, Mark as Unread, Categorize, Follow Up, Assign Policy, Find Related, Quick Steps, Set Quick Actions..., Rules, Move, Send to OneNote, Ignore, Block Sender, Never Block Sender, Never Block Sender's Domain (@example.com), Never Block this Group or Mailing List, Not Junk, and Junk E-mail Options... The 'Junk' option is highlighted with a red rectangle.

You can *always* "fact check" an email sender if you catch something unusual with the email. Do this by looking specifically at the sender address. For example, if their email address domain doesn't end in gracechurches.org, graceohio.org, or gracegeorgia.org, then the email was definitively sent from outside of our organization. Take a look at the below example of the sender address for Amazon:

Sender Address Example	

NEVER EVER open any attachment in an email originating from outside that you don't recognize. This attachment is very likely designed to compromise your computer and cause very bad things to happen.

v v v

For this very reason, we don't allow ZIP files to be sent/received via email in our tenant since malware in a ZIP file can easily mask itself from antivirus scans and avoid malicious detection. If you or someone you know is trying to send several files to the other person, look into using cloud storage like OneDrive or Google Drive to share files from there. Reference our Sharing guide for OneDrive and SharePoint if you need to share several files:
